

# Total Quality Management and Six Sigma

Post Graduate Program 2014-15

## Session 2

Vinay Kumar Kalakbandi  
Assistant Professor  
Operations & Systems Area

09/11/2014

Vinay Kalakbandi

1

## Recap

- Quality definitions
- History of quality thinking
- Present era challenges
- Group formation

09/11/2014

Vinay Kalakbandi

2

# Agenda

- Statistical Process Control
- Process Control at Polaroid Case

## The process view

- The Red Bead experiment
  - <https://www.youtube.com/watch?v=ckBfbvOXDvU>

## The process view

- Service/Manufacturing processes are characterized by
  - Output: Service outcome that determines service quality
  - Input: Customer inputs, Resources, employees
  - Variability: Dispersion in output
    - **Natural causes:** Non-controllable; inherent variability in the system, noise, usually minor
    - **Assignable causes:** Controllable, bring about a fundamental change on the nature of the process, causes considerable impact on quality

09/11/2014

Vinay Kalakbandi

5

## Pre-requisites

- Mean and standard deviation
- Random variables and Probability distribution
  - Normal distribution
- Type 1 and Type 2 errors
- Central limit theorem

09/11/2014

Vinay Kalakbandi

6

## Process control charts

- Information: Monitor process variability over time
- Control limits: Average +  $\bar{\sigma}$  Normal variability
  - $\bar{\sigma} = 3$
- Decision Rule: Ignore variation outside “abnormal”
- Errors: Type 1 and Type 2

09/11/2014

Vinay Kalakbandi

7

## Types of Data

- Variable data
  - X-bar and R charts
  - Time, customer satisfaction scores
- Attribute data
  - p-charts and c-charts
  - Good/bad, yes/no, number of errors!

09/11/2014

Vinay Kalakbandi

8

## Rest of the discussion

- Different charts have different purposes
- Constructing a control chart
- Knowing when things have gone wrong
- Process capability
- Six sigma!

## Constructing a control chart

- Decide what to measure and count
- Collect sample data
- Calculate and plot control limits on the control chart
- Determine if data is in control
- If non-random variation is present, fix the problem and recalculate control limits.

### Example: Control Charts for Variable Data

Sample	Ambulance response time (in minutes)					$\bar{X}$	R
	1	2	3	4	5		
1	5.02	5.01	4.94	4.99	4.96	4.98	0.08
2	5.01	5.03	5.07	4.95	4.96	5.00	0.12
3	4.99	5.00	4.93	4.92	4.99	4.97	0.08
4	5.03	4.91	5.01	4.98	4.89	4.96	0.14
5	4.95	4.92	5.03	5.05	5.01	4.99	0.13
6	4.97	5.06	5.06	4.96	5.03	5.01	0.10
7	5.05	5.01	5.10	4.96	4.99	5.02	0.14
8	5.09	5.10	5.00	4.99	5.08	5.05	0.11
9	5.14	5.10	4.99	5.08	5.09	5.08	0.15
10	5.01	4.98	5.08	5.07	4.99	<u>5.03</u>	<u>0.10</u>
						50.09	1.15

### Constructing A Mean Chart

$$UCL_{\bar{X}} = \bar{\bar{X}} + A_2 \bar{R} = 5.01 + (0.58)(.115) = 5.08$$

$$LCL_{\bar{X}} = \bar{\bar{X}} - A_2 \bar{R} = 5.01 - (0.58)(.115) = 4.94$$

where  $\bar{\bar{X}}$  = average of sample means =  $\sum \bar{X} / n$   
 $= 50.09 / 10 = 5.01$

$$\bar{R} = \text{average range} = \sum R / k$$

$$= 1.15 / 10 = .115$$

09/11/2014

Vinay Kalakbandi

12

## Constructing an Range Chart

$$UCL_R = D_4 \bar{R} = (2.11) (.115) = 2.43$$

$$LCL_R = D_3 \bar{R} = (0) (.115) = 0$$

where  $\bar{R} = \sum R / k = 1.15 / 10 = .115$

$k$  = number of samples = 10

$R$  = range = (largest - smallest)

## 3 $\sigma$ Control Chart Factors

Sample size <b>n</b>	$\bar{X}$ -chart	R-chart	
	<b>A<sub>2</sub></b>	<b>D<sub>3</sub></b>	<b>D<sub>4</sub></b>
2	1.88	0	3.27
3	1.02	0	2.57
4	0.73	0	2.28
5	0.58	0	2.11
6	0.48	0	2.00
7	0.42	0.08	1.92
8	0.37	0.14	1.86

# Output

09/11/2014

Vinay Kalakbandi

17

# Other charts

- P-charts
  - Calculate percentage defectives in a sample
  - an item is either good or bad
  - Based on binomial distribution
    - $p = \text{number defective} / \text{sample size, } n$
    - $\bar{p} = \frac{\text{total no. of defectives}}{\text{total no. of sample observations}}$
    - $$UCL_p = \bar{p} + 3\sqrt{\bar{p}(1-\bar{p})/n}$$
    - $$LCL_p = \bar{p} - 3\sqrt{\bar{p}(1-\bar{p})/n}$$

09/11/2014

Vinay Kalakbandi

18

## Other charts

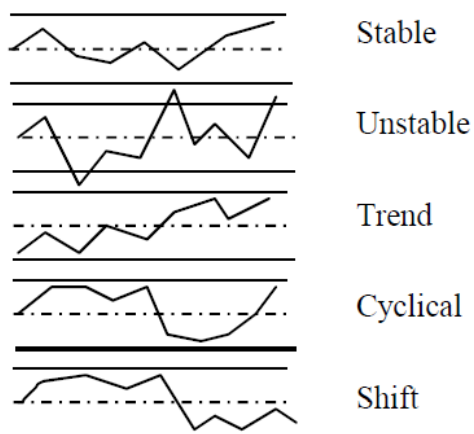

- c Charts
  - Count number of defects in an item
  - Based on poisson distribution
    - $c$  = number of defects in an item
    - $\bar{c} = \frac{\text{total number of defects}}{\text{number of samples}}$
    - $UCL_c = \bar{c} + 3\sqrt{\bar{c}}$
    - $LCL_c = \bar{c} - 3\sqrt{\bar{c}}$
